Introduction

This project involves creating a web page that promotes Lyon to tourists. The page must be accessible at wsXX.worldskills.org/XX_module_e/, where XX represents the seat number.

Description of project and tasks

In this project, you are required to implement a web page design.

The layout should include the following sections:

- Header
- Call-to-Action section
- Tourist Attractions Map
- Video Playback
- Essential Information
- Latest Events
- Information Tabs
- Event Calendar
- Reviews
- Coupon Event
- Contact Form
- Footer

Refer to The layout.png in the media file for your implementation. However you are free to implement the layout for Event Calendar, Reviews and Coupon Event.

Header

The header navigation sticks to the top of the screen while scrolling.

It also features a blurry glass effect.

Refer to header-navigation.png for details.

Call-to-Action section

The next section is the Call-to-Action section.

It features a large cover image as the background.

In the center of this section, there is a Call-to-Action button.

The button has a hover effect that follows the mouse cursor — it glows and its border expands.

Refer to call-to-action-effect.mp4 for a demonstration of this effect.

Map attractions

This section displays a static map image on the right and three attraction cards on the left.

The map remains fixed on the right, and it includes spot markers corresponding to the three attraction cards on the left.

© WorldSkills ASEAN

On the left, a 2×2 grid layout presents three cards that link to individual attractions, while the fourth card links to a full list of attractions.

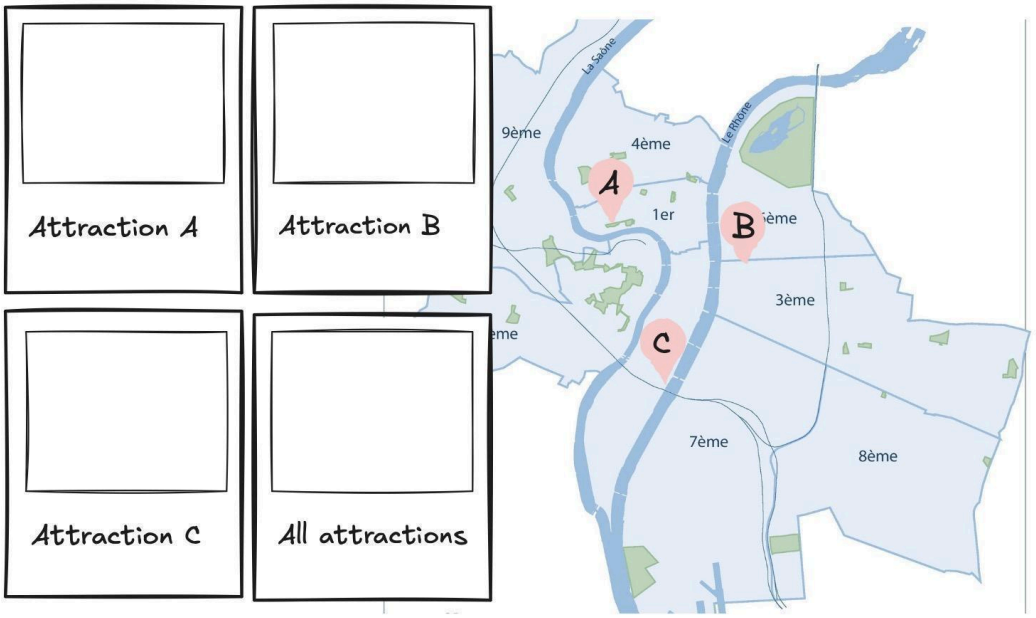
Since this is a prototype project, the links should use empty URLs.

When the mouse hovers over a spot on the map, the corresponding attraction card is highlighted with a zoom and box-shadow effect.

Box-shadow effect: 1.05× scale, shadow offset 5px on the Y-axis, blur 5px, and color is black with 30% opacity.

When hovering over an attraction card, the same focus effect applies, along with a subtle lighting gradient that sweeps from left to right across the card.

For more details, refer to the card-light-effect.mp4 file.



Video playback

After the map section, there is a video section featuring a muted video with no sound.

The video automatically plays when it becomes visible as the user scrolls. If the video scrolls out of view, it automatically pauses. When it becomes visible again, playback resumes.

Autoplay is triggered when approximately 50% of the video is visible in the viewport.

This behavior also applies to the visibility of the web page itself. If the webpage becomes hidden (e.g., switching tabs), the video pauses. When the page becomes visible again, the video resumes playing.

© WorldSkills ASEAN

Essential information

The section following the video is the Essential Information section, which contains important contact addresses and phone numbers.

It includes a button that plays the address information in French using text-to-speech (TTS) technology.

When the user clicks this button, the address is audibly played in French through the computer or mobile device's speakers or headphones.

Latest Events

The Latest Events section contains event cards.

These cards are laid out horizontally, and if the total width exceeds the page, horizontal scrolling is enabled.

The event cards share the same styling as the map attraction cards.

Event data can be found in the latest-events.txt file, and the corresponding images are located in the latest-events-images folder.

Other Information Tabs

After the Latest Events section, there is a section that displays additional information. The content is grouped into tabs, and the text data is provided in the other-information-tabs.txt file.

To ensure reusability of the tab elements, implement the tabs as custom elements according to the HTML standard. This technique is known as a Web Component and typically involves creating a custom class that extends HTMLElement.

Tab switching should be supported via both mouse clicks and keyboard navigation using the left and right arrow keys when a tab is focused.

Implement appropriate aria attributes for accessibility. At minimum, include:

- aria-selected
- aria-hidden
- aria-labelledby (which should associate the tab with its title and content)

Note: You must not use prebuilt tab components from third-party UI libraries. All tab functionality must be implemented manually using standard web technologies.

Event Calendar

This is a calendar that displays events taking place in Lyon.

You can navigate to the previous or next month using the Prev and Next buttons.

Today’s date, as well as Saturdays and Sundays, are styled differently from the other days.

All data provided in events.json must be shown in the event calendar.

Each event should be placed according to its date range and display its title.

Each category should have a distinct color.

When the user clicks on an event title, a popup appears showing all details of the event.

© WorldSkills ASEAN

Review

Initially, the first review is centered (i.e. there is no review card on the left).

When the Next button is clicked, the next review card slides into the center and the center review card slides to the left.

When the Prev button is clicked, the prev review card slides into the center and the center review card slides to the right.

The centered review card should be displayed larger to draw the user's attention.

The cards before and after the centered one should be styled differently to appear less prominent.

There is no media reference for this implementation.

Coupon Event

Create a mini-game that includes engaging elements to capture the user's interest.

The result of the game should award one of the following:

"No prize", a 10% discount coupon, or a 100% discount coupon.

At the end of the game, a Restart button must be provided so that users can play again.

Contact form

A contact form must be implemented using the following fields:

- First Name
- Last Name
- Contact Email Address
- Contact Phone Number

The contact form layout should follow the one shown in the media file.

Each field must be assigned a logical tab index to ensure proper keyboard navigation.

In this project, the form serves as a placeholder, so the form’s action attribute must be set to an empty URL (i.e., action="").

Footer

The footer should be a standard multi-column layout, following the provided design.

Text content for the footer is available in the footer-content.txt file.

Offline Access

When the device is offline, a minimal version of the web page should be displayed.

This page includes the header and the Essential Information section, along with a message informing the user that the site is currently in offline mode.

This applies when a user attempts to access the web page while the device has no internet connection.

© WorldSkills ASEAN

Once the device comes back online, the full version of the web page should be displayed.

Images Loading Responsiveness

When the screen width is less than 760px, the web page loads the provided low-resolution image files.

When the screen width is at least 760px, high-resolution images are used.

Instructions to the Competitor

Accessibility must be considered when implementing the design.

All images must have appropriate alternative text.

All text content must be readable by screen readers.

This project will be evaluated in Google Chrome, and accessibility will be assessed using the axe dev Tool Chrome extension.

Other

This project will be evaluated using the Google Chrome web browser.

If necessary, you may provide a README file to guide how to run the project.

Marking Summary

	Sub-Criteria	Marks
1	Responsive loading	2.1
2	Video playback	2.5
3	Design and Layout Implementation	4.5
4	Effects	3.0
5	Accessibility	2.5
6	Tabs	1.4
7	Calendar	3.0
8	Review	2.0
9	Coupon Event	1.5
